VOLVO 850/S70/V70 STRUT TOWER TO TOWER BRACE

* Additional fitting instructions for vehicles fitted with fuse box in the left rear corner of the engine bay. Fuse box bracket is mounted to the left strut tower.

1. Remove the fuse box bracket from the top of the left strut tower and remove the fuse box from the bracket.
2. Using the diagram on this page as a template, and using the two holes (marked 'A') to correctly align the template, mark out the area to be removed from the bracket.
3. Remove the marked metal and then, with the strut tower brace top plate in place, check that the modified bracket fits between the two lugs. Some additional filing may be required.
Once the bracket fits correctly to the top plate, paint the raw edges to prevent corrosion.
4. Fit the finished bracket the fuse box prior to fitting the strut brace cross bar.
